Mastervolt controls it

Irrespective of the weather

When the forecast is no longer relevant

With the Sunmaster, Dutch company Mastervolt has produced an inverter which converts any type of sunlight in any weather into profitable power, from the early morning late into the night.

Early morning, the sun is just sending its first rays across the horizon. The Mastervolt Sunmaster is starting up. The weak light is enough for the Sunmaster to produce energy. A cloud passes briefly over the glistening star – it doesn't matter; the Sunmaster continues to deliver energy. It really clouds over, starts raining and becomes dismal – the Sunmaster runs and runs and runs. Then it really cranks up again, when the sky brightens up and the sun appears in the blue sky. And even in the twilight, the kilowatt hours meter continues to tick on....

Of course, Mastervolt can't influence the weather. But it doesn't really need to. Because the Mastervolt Sunmaster inverters are real energy producers when it comes to sunlight. They work from early morning until late into the night. Their productivity and efficiency are astounding. They can transform any type of sunlight into profitable energy.

It does this thanks to its extremely low consumption and perfect cooling, even at high ambient temperatures. It fits virtually all solar modules, irrespective of thin-film or crystalline and can be integrated into any photovoltaic system. And another advantage should not be overlooked. The Mastervolt Sunmaster inverters are quick and easy to install.

They automatically turn on after installation and commissioning as soon as they are exposed to solar radiation, irrespective of the type. Then the story begins again in the next household:

Early morning, the sun is just sending its first rays across the horizon. The Mastervolt Sunmaster is starting up ...
